5) B/c Dijkstra's algo. would keep pointing back to that vertex w/ the negative value in many circumstances. It also doesn't work logically: It'd be like a toll road that paid you to drive on it. Dijkstra assumes to visit each vertex once, whereas a negative vertex would loop through that vertex to decrease overall cost.

James Villamarotto

CLSC 220-012

Dec. 5, 2019

- 6) B/c the largest-cost path would be infinitely big where it loops through the nodes repeatedly in an adjacency matrix of three or more vertices:
